

This week we're taking a look into Data Governance and taking it a step further then the Masking Policy and Row Access Policies that usually get all of the attention.

We're going to protect a column from being queried completely BUT we'd still like to be able to use it for our joins.

Start-up code

The challenge this week is a bit different in that we want you to work towards an error instead of a solution. The error in question :

*error caused by SELECT * FROM PersonalDetail*

This error SHOULD popup when we execute a 'SELECT * FROM PersonalDetails' but we should still be able to run the following :

```
SELECT p.FirstName, p.LastName, e.CompanyName, e.Position, e.StartDate, e.Salary
FROM PersonalDetails p
JOIN EmploymentDetails e ON p.SSN = e.SSN;
```
