

Just ten days ago Snowflake announced the *general availability* of creating a new table when loading a file in Snowsight. How? By using the INFER_SCHEMA table function to automatically detect the file metadata schema, retrieve the column definitions, and generate a new table.

All you need to do is:

1. Log on to Snowsight.
2. Go to the "Data" section in the navigation menu, then select "Databases."
3. Choose a specific database and schema you want to work with.
4. Click "Create."
5. In the drop-down menu, select "Table" and then choose "From File."

And voila, you'll discover how cool this new feature is! It will certainly save you time!
